

IN THE CLAIMS

The text of all claims under examination is submitted, and the status of each is identified. This listing of claims replaces all prior versions, and listings, of claims in the application.

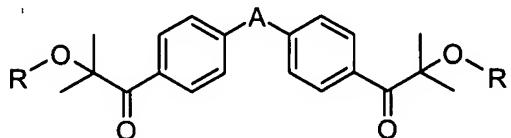

1. (cancelled)

2. (currently amended) A photoinitiator according to claim-4, wherein A is -O-, -CH₂- or -CH(CH₃)-, and R is methyl.

3. (cancelled)

4. (currently amended) A composition comprising

- (A) an ethylenically unsaturated compound that contains at least one aminoacrylate,
- (B) a photoinitiator of formula I according to claim 1,

wherein

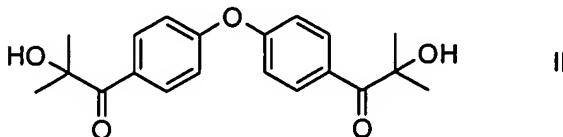

A is -O-, -CH₂-, -CH(CH₃)- or -C(CH₃)₂-,

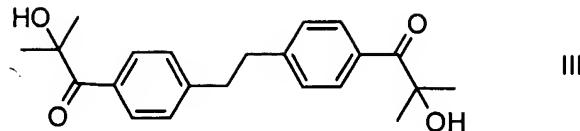

and R is methyl or trimethylsilyl, and R may be hydrogen when A is simultaneously the group -C(CH₃)₂-.

- (C) optionally further binders or additives,
- (D) optionally further photoinitiators or co-initiators.

5. (original) A composition comprising

- (A) an ethylenically unsaturated compound that contains at least one aminoacrylate,
- (B) a photoinitiator of formula II or III

- (C) optionally further binders or additives,
- (D) optionally further photoinitiators or co-initiators.

6-8. (cancelled)

9. (currently amended) A process for the production of a scratch-resistant durable surface, wherein a composition according to claim 4 is applied to a support, and curing of the formulation is carried out either solely by irradiation with electromagnetic radiation of a wavelength ranging from 200 nm into the NIR or IR region, or by irradiation with electromagnetic radiation and prior, simultaneous and/or subsequent action of heat.

10. (previously presented) A composition according to claim 4 which is selected from the group consisting of pigmented or unpigmented surface coatings, overprint coatings, formulations for printing inks, powder coatings, inkjet inks, fine layers (gel coats), composite materials and glass fibre cable coatings.

11. (previously presented) A substrate that has been coated on at least one surface with a composition according to claim 4.

12. (currently amended) A process for the production of a scratch-resistant durable surface, wherein a composition according to claim 5 is applied to a support, and curing of the formulation is carried out either solely by irradiation with electromagnetic radiation of a wavelength ranging from 200 nm into the NIR or IR region, or by irradiation with electromagnetic radiation and prior, simultaneous and/or subsequent action of heat.

13. (previously presented) A composition according to claim 5 which is selected from the group consisting of pigmented or unpigmented surface coatings, overprint coatings, formulations for printing inks, powder coatings, inkjet inks, fine layers (gel coats), composite materials and glass fibre cable coatings.

14. (previously presented) A substrate that has been coated on at least one surface with a composition according to claim 5.
